### DONATION DATA

**Another Record Breaking Year!**

Thank you to All of DNA’s physician partners for helping us make the most of life.

- **275k** New Additions to the Donate Life AZ Registry
- **1,047** Corneas Transplanted
- **701** Lives Saved
- **1,031** Tissue Donors
- **267** Organ Donors
- **74%** of organs recovered in Arizona were transplanted in Arizona

What initially sparked your interest in donation?

I think the entire process around organ donation and organ transplantation is humbling from a humanistic standpoint, and amazing from a medical advancement standpoint. I believe part of our duty as members of society is to contribute to our greater community, in whatever ways we are able and see fit. For the donors, it is the final gift that they give back, and one of the most meaningful and generous. Another human being’s quality and length of life is directly changed for the better as a result.

Why did you take on the role as a physician champion for donation at BUMCT?

There are many causes in life that we should advocate for passionately. I see organ donation as an important aspect of healthcare and for the betterment of the subset of our population in organ failure. Living with a failing organ, whether it be the liver, kidney or ocular lens, can be a very difficult existence. It limits one’s fulfillment of their life’s potential. On one hand, what little I can contribute in this process of care is meaningful to me. On the other hand, my position as a trauma surgeon and director of trauma at our Level I Trauma Center allows me the opportunity to influence the quality of care from the donor management standpoint, particularly considering a significant number of organ donors are trauma victims. I believe it is our obligation as healthcare providers to take the very best care of the donor patients so their desire for the gift of organ donation can be best honored.

What do you think donation offers to your patients’ families?

Remembrance, closure and peace. They will always remember that part of their loved ones exists in another human being, and is directly responsible for that person’s improved life and their reintegration back into society. I like to think that to a certain extent, that brings peace and closure to the donor’s families.

Where do you see donation going in the future?

In the distant future, I see organ engineering from stem cells. The organs will be biochemically perfectly compatible with the recipients, thus eliminating the need for all the immunosuppressive medications that our transplant patients currently have to take. Prior to that, I would like to see more global awareness of the need for organ donation given our shortage of available organs compared to the number of people living with organ failures. Also, I hope for the public to be more aware of how transplant recipients’ lives are so drastically changed for the better because of the generous gift of organ donation by someone else.
